

BREEDER CAGE

BREEDER CAGE

	A LENGTH	B DEPTH	C HEIGHT	MOVEMENT AREA	NUMBER OF BIRDS
BF 50	2700 mm	1200 mm	820 mm	648 cm ²	45

FEEDING SYSTEM

- Our feeding systems ensure that the feed is distributed homogeneously, safely and quickly.
- Our feeders are designed in a way that the distributed feed can reach each tier at the same time and without spilling over.
- In the egg production field, one of the factors that directly affect the production of eggs is feeding.

WATERING SYSTEM

- Our watering elements in the cage cells are provided with PVC square shaped pipes.
- There are 16 stainless steel nipples in 2 lines in each cells.
- The medicator system; the intended amount of medicine, vaccine and vitamin will be add into the water and send to nipples.
- Thanks to the bowls at the bottom excess water is prevented from reaching the manure belt.

EGG COLLECTING SYSTEM

- The most important consideration during the egg collection process is to minimize cracks and breakages in the eggs.
- Eggs are transferred to the conveyor via egg belts extending along the line and are transported to the egg room in a precise, fast and reliable manner.

MANURE DISCHARGING SYSTEM

- The manure removal is contutuated of a POLYPRO- PYLENE (plastic) manure band under each tiers.
- The cleaning scrapers at the end of each line keep it clean.
- Manure collected via the manure band are transferred to conveyors that carried it out from the poultry house.
